8. Acute Asthma Exacerbation Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient's individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

- Monitor, support ABCs
- Start Oxygen IF SPO₂ < 92%. Maintain SPO₂ ≥ 92%; Oxygen should be provided to all patients with severe asthma, even those with normal oxygenation.
- Perform brief, targeted history, physical exam (auscultation, use of accessory muscles, PR, RR)
- Initiate treatment of underlying cause of exacerbation
- Check Peak Expiratory Flow (PEF) as per PEF Chart below and record predicted or best PEF (%) in patient's clinical notes.

 DO NOT measure PEF in patients with impending/actual respiratory arrest, drowsiness, confusion or silent chest. Start treatment

DO NOT measure PEF in patients with impending/actual respiratory arrest, drowsiness, confusion or silent chest. Start treatment immediately.

DROWSINESS, CONFUSION, OR SILENT CHEST?

- Give high-dose IV Magnesium, 2gm in 5% Dextrose over 20-min
- •Consider intubation (RSI with Ketamine if no C/I) and ventilation with 100% oxygen; anticipate cardiovascular collapse postintubation
- •Get CXR
- Nebulise* with Salbutamol +
 Ipratropium bromide (doses below)
 every 20 mins or 3 doses for 1 hour. A
 combination of 4 mL volume fill with
 NS and 6 to 8L/min oxygen flow rate is
 recommended.
- Give IV Hydrocortisone 2mg/kg (maximum 200mg) immediately
- Admit to HDU/ICU

MILD or MODERATE PEF > 50 % predicted or best

Talks in phrases, prefers sitting to lying, not agitated O₂ saturation (on air) 90-95% Pulse Rate 100-120 bom

- Nebulise with Salbutamol +
 Ipratropium bromide (doses
 below) every 20 mins or 3 doses
 for 1 hour. A combination of 4 mL
 volume fill with NS and 6 to
 8L/min oxygen flow rate is
- Give Oral (if patient can swallow)
 or IV systemic corticosteroids
 (dose below) immediately
- Continuing clinical deterioration

recommended

SEVERE

PEF ≤ 50 % predicted or best

Talks in words, sits hunched forwards,
agitated

O₂ saturation (on air) < 90% Pulse Rate > 120 bpm

- Nebulise* with Salbutamol +
 Ipratropium bromide (doses below)
 every 20 mins or 3 doses for 1 hour.
 A combination of 4 mL volume fill
 with NS and 6 to 8L/min oxygen flow
 rate is recommended.
- Give IV Hydrocortisone 2mg/kg (maximum 200mg) immediately

PEF > 60-80% of predicted or personal best

No Distress

Reassess Hourly (or after every 3 doses)

Symptoms, physical exam + BP, PR, RR, SpO₂, PEF

- Physical Exam Normal
- Response sustained 60 minutes after last treatment

Discharge Home

- \bullet Continue treatment with inhaled SABA 2 puffs QID for 3-5 days
- Give oral systemic corticosteroids: Dexamethasone 0.6mg/kg or 12mg for adults as a single dose or Prednisone (see dose in table below)
- Review medication including inhaler technique
- Consider therapy for underlying cause of exacerbation
- Refer to Chest Physician for follow-up

Medication	Dose	Comments
Inhaled SABA		
Salbutamol		
Nebulizer solution (0.63 mg/3 mL, 1.25mg/3mL, 2.5 mg/3 mL, 5.0 mg/mL)	5 mg every 20 min for 3 doses, then 2.5–10 mg every 1–4 h as needed, or 10–15 mg/h continuously	Only selective β -agonists are recommended. For optimal delivery, dilute aerosols to minimum of 3 mL at gas flow of 6–8 L/min. Use large-volume nebulizers for continuous administration. May mix with ipratropium nebulizer solution.
pMDI (90μg/puff)	4–10 puffs every 20 min up to 4h, then every 1–4 h as needed	In mild to moderate exacerbations, pMDI plus spacer is as effective as nebulized therapy with appropriate administration technique and coaching by trained personnel.
Systemic (Injected) β2-Agonists		
* Adrenaline 1:1,000 (1 mg/mL)	0.3–0.5 mg SC every 20 min for 3 doses	No proven advantage of systemic therapy over aerosol
Anticholinergics		
Ipratropium bromide		
Nebulizer solution (0.25mg/mL)	0.5 mg every 20 min for 3 doses, then as needed	May mix in same nebulizer with salbutamol. Should not be used as first-line therapy; should be added to SABA therapy for severe exacerbations. The addition of Ipratropium has not been shown to provide further benefit once the patient is hospitalized.
pMDI (18 μg/puff)	8 puffs every 20 min as needed up to 3 h	Should use with spacer. Studies have examined I pratropium bromide MDI for up to 3 h.
Ipratropium with salbutamol		
Nebulizer solution (Each 3-mL vial contains 0.5mg ipratropium bromide and 2.5 mg salbutamol.)	3 mL every 20 min for 3 doses, then as needed	May be used for up to 3 h in the initial management of severe exacerbations. The addition of ipratropium to sabutamol has not been shown to provide further benefit once the patient is hospitalized.
MDI (Each puff contains 18μg Ipratropium bromide and 90μg salbutamol.)	8 puffs every 20 min as needed up to 3 h	Should use with spacer.
Systemic Corticosteroids		
Prednisone	40–80 mg/d in 1 or 2 divided doses until PEF reaches 70% of predicted or personal best	For outpatient "burst," use 40–60 mg in single or 2 divided doses for a total of 5–10 d.
Hydrocortisone	200mg IV then 1mg/kg/dose IV QID	Only if patient cannot tolerate PO corticosteroids

ED = emergency department; ICS = inhaled corticosteroid; MDI = metered-dose inhaler; PEF = peak expiratory flow; SABA = short-acting β2-adrenergic agonist Notes: There is no known advantage for higher doses of corticosteroids in severe asthma exacerbations, nor is there any advantage for intravenous administration over oral therapy provided gastrointestinal transit time or absorption is not impaired. The total course of systemic corticosteroids for an asthma exacerbation requiring an ED visit or hospitalization may last from 3 to 10 days. For corticosteroid courses of <1 week, there is no need to taper the dose. For slightly longer courses (e.g., up to 10 d), there probably is no need to taper, especially if patients are concurrently taking ICSs. ICSs can be started at any point in the treatment of an asthma exacerbation.

How to Measure Peak Expiratory Flows (PEF)

DO NOT measure PEF in patients with impending/actual respiratory arrest, drowsiness, confusion or silent chest. Start treatment immediately.

- Put the pointer on the gauge of the peak flow meter to 0 or the lowest number on the meter.
- 2. Attach the mouthpiece to the peak flow meter.
- 3. While standing, take a deep breath.
- Put the peak flow meter mouthpiece in your mouth and close your lips tightly around the outside of the mouthpiece. Don't put your tongue inside the mouthpiece.
- Breathe out as hard and as fast as you can for 1 or 2 seconds. A hard and fast breath usually produces a "huff" sound.
- 6. Check the number on the gauge and write it down.
- 7. Repeat the above 3 times and take the patient's best PEF
- 8. Plot the best PEF on the normal values chart and calculate the percentage as below

Measured PEF X 100% *available in MDCalc
Normal PEF

9. Record the PEF in the patient's clinical notes
